What types of animals and insects are found in this habitat?

- Some animals that live in the meadow are opossum and a chipmunk .
- Insects that are in the meadows are a honey bee and a firefly.

Why are meadows important to the environment?

- Meadows have declined over the years
- Created by centuries of traditional farming practices
- Low input low output systems for feeding a small amount of sheep and cattle
- At the Nature Center some animals wouldn't live in other climates, like chipmunk and brown bat

What important roles do these creatures play in a meadow ecosystem?

The roles that the creatures play is the honey bees spread pollen and chipmunks eat nuts, insects, different grains.

**Name two animals and insects
that are mostly found in the
meadow habitat.**

- Brown bat and chipmunk
- Ivy and goldenrod
